# The Deep Underground Neutrino Experiment (DUNE): ND-LAr and the 2x2 Demonstrator

Kevin Wood, [kwood@lbl.gov](mailto:kwood@lbl.gov), on behalf of the DUNE Collaboration

CoSSURF 2024, Sanford Underground Research Facility

May 14, 2024

# DUNE Overview

- Long-baseline accelerator-based neutrino oscillation experiment that will vastly improve the precision of neutrino oscillation parameter measurements
  - Mitigation of statistical uncertainties:
    - Unprecedented neutrino beam intensity: 1.8 MW → 2.1 MW
    - Massive far detector: up to 4 modules with 17 kton LAr / module
  - Mitigation of systematic uncertainties:
    - Highly performant near detector complex

# Example: T2K Systematic Uncertainty

- Systematic errors are greatly constrained by near detectors
- Systematic errors on the shape of the distributions also have important impact on oscillation measurements
- Results limited by statistics
- Off-axis → sampling narrow energy band
  - DUNE’s wide band beam will be more challenging

*Eur. Phys. J. C (2023) 83:782*

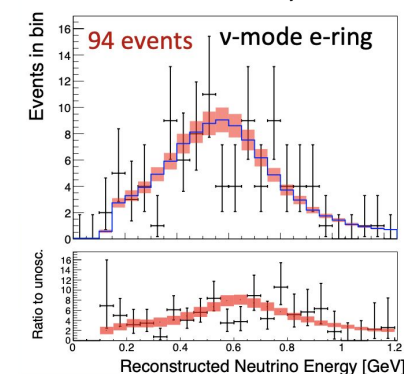

Sample		Uncertainty source (%)			Flux⊗Interaction (%)	Total (%)
		Flux	Interaction	FD + SI + PN		
1Rμ	$\nu$	2.9 (5.0)	3.1 (11.7)	2.1 (2.7)	2.2 (12.7)	3.0 (13.0)
	$\bar{\nu}$	2.8 (4.7)	3.0 (10.8)	1.9 (2.3)	3.4 (11.8)	4.0 (12.0)
1Re	$\nu$	2.8 (4.8)	3.2 (12.6)	3.1 (3.2)	3.6 (13.5)	4.7 (13.8)
	$\bar{\nu}$	2.9 (4.7)	3.1 (11.1)	3.9 (4.2)	4.3 (12.1)	5.9 (12.7)
1Re1de	$\nu$	2.8 (4.9)	4.2 (12.1)	13.4 (13.4)	5.0 (13.1)	14.3 (18.7)

*Current T2K uncertainty on integrated event rates with (without) the near detector constraints*

T2K Run 1-10 Preliminary

T2K Run 1-10 Preliminary

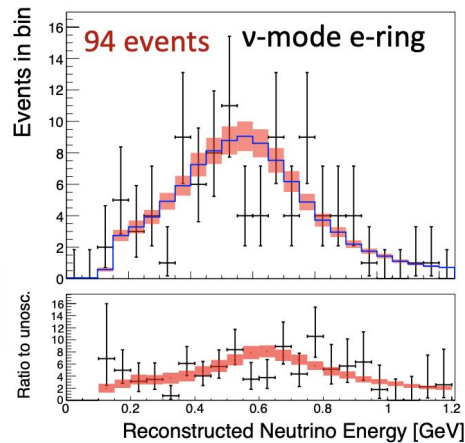

<https://doi.org/10.5281/zenodo.3959558>

# Enter DUNE

- Compare 10 years of T2K data to projection for the first few years of DUNE data
  - “Low exposure long-baseline neutrino oscillation sensitivity of the DUNE experiment” [Phys.Rev.D 105 072006 \(2022\)](#)
  - Projected spectra for 100 kt-MW-CY exposure
    - Few years of data assuming 57% uptime and NuFIT 4.0 best fit

T2K Run 1-10 Preliminary

T2K Run 1-10 Preliminary

# DUNE (Phase 1) Near Detector Complex

- **Moveable LArTPC system**

- ND-LAr: novel LArTPC with pixelated readout and 70 optically isolated TPC volumes
- TMS: spectrometer for momentum and charge measurement of  $\nu_{\mu}$ -CC muons exiting ND-LAr
- PRISM: ND-LAr + TMS system moves up to 28.5m (2.8°) off-axis

- **Multi-purpose on-axis magnetized detector**

- SAND: Straw tube tracker with Argon target inside KLOE superconducting solenoid

# ND-LAr Detector

- 7x5 grid of 1x1x3 m<sup>3</sup> LArTPC modules
  - 7x5x3 m<sup>3</sup> active volume
- Moveable transverse to neutrino beam
  - Sample off-axis flux
- Designed to cope with high-pileup environment
  - ~60 interactions / 1.2 MW spill
- Optical segmentation provides interaction-level timing information
- Native 3D readout from pixelated charge readout mitigates hit ambiguity
  - $\lesssim$  4mm pixel pitch (granularity)
  - $>$  14M pixel channels!

# 1.2 MW LBNF Spill Simulation

# Coping with Pileup

- LArTPC charge readout very slow compared to beam microstructure
  - ~300us maximum drift, ~10us beam spill
- Leverage scintillation light readout for timing information: must match charge to light

Simulated energy deposits from 1.2 MW LBNF Beam Spill in ND-LAr

## Full Detector Volume (no smearing)

Full Detector Volume (no smearing)

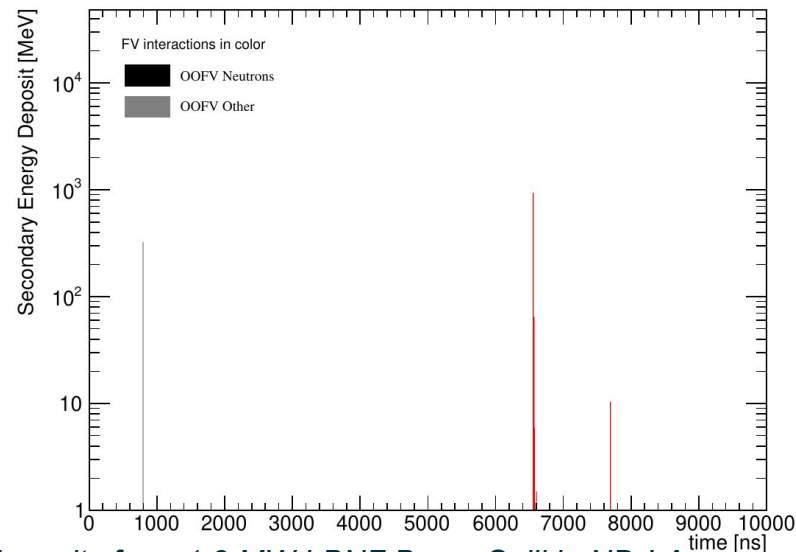

# Coping with Pileup

- LArTPC charge readout very slow compared to beam microstructure
  - ~300us maximum drift, ~10us beam spill
- Leverage scintillation light readout for timing information: must match charge to light
  - enabled through optical segmentation

**1/70th Detector Volume (no smearing)**

*Simulated energy deposits from 1.2 MW LBNF Beam Spill in ND-LAr*

# ND-LAr Module

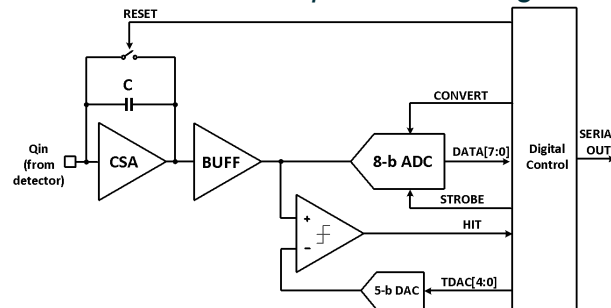

- 2 optically isolated TPCs per module
  - 50 cm drifts → 25 kV for 500 V/cm
- Pixelated charge readout with  $O(4\text{mm})$  granularity
- Light readout with modules on the vertical field cage panels

# LArPix Charge Readout System

- Pixel tile PCB containing 1000's of pixels/ft<sup>2</sup> and minimal active components
- LArPix ASIC loaded onto backside of pixel tiles
- Scalable system for instrumental large areas:
  - **Data rates:** made manageable by channel-by-channel self-triggering
  - **Cryogenic compatibility:** < 100μW / channel
  - **Affordable:** Full system cost approaching ~\$0.10/channel or ~\$10k/m<sup>2</sup>
  - **Practical:** All components produced by commercially available vendors
  - **Robust:** Hydra I/O Networking provides protection against single ASIC failures

*LArPix v2 conceptual block diagram*

*pixel tiles (+light traps)*

*LArPix v2b bare die*

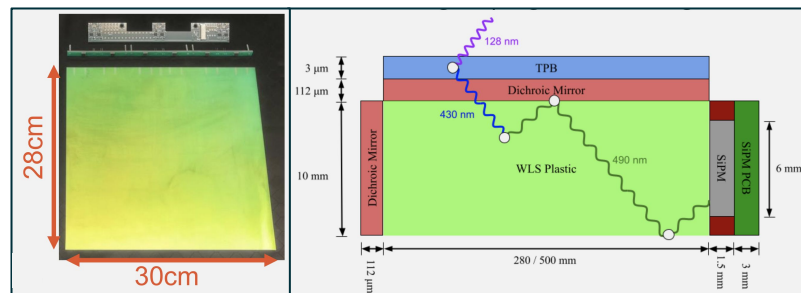

# Light Readout System

- Two complementary designs for light traps
  - Increase coverage with fixed channel count

	ArcLight	LCM
Efficiency	~0.2%	~0.6%
Spatial resolution	~5cm	~10cm
Notes	<ul style="list-style-type: none"> <li>– Large sense area</li> <li>– High dynamic range</li> </ul>	<ul style="list-style-type: none"> <li>– Scalable design</li> <li>– Mechanically robust</li> </ul>

- <10ns single hit timing resolution
- Common SiPM readout system
  - Analog signals feedout from cryo
  - VGA and ADC cards in VME crates on the warm side
- Common control and DAQ software

ArcLight module [prototype dimensions]

LCM [prototype dimensions]

# 2x2 Demonstrator

- Demonstration of ND-LAr design in reconstructing neutrino interactions
- 2x2 array of 1.2 x 0.6 x 0.6 m<sup>3</sup> modules containing >300K pixel channels
- 4 modules operated individually at University of Bern
  - $O(10^9)$  cosmic events

[arXiv:2403.03212](https://arxiv.org/abs/2403.03212)

*raw data!*

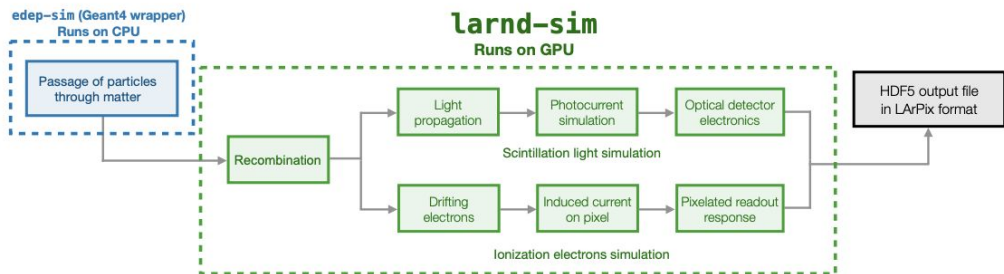

# 2x2 Demonstrator

- Demonstration of ND-LAr design in reconstructing neutrino interactions
- 2x2 array of 1.2 x 0.6 x 0.6 m<sup>3</sup> modules containing >300K pixel channels
- 4 modules operated individually at Bern
  - O(10<sup>9</sup>) cosmic events
- @ Fermilab underground facility (MINOS hall) between repurposed Minerva planes
- Will measure neutrino interactions in the GeV-energy regime from the NuMI beam

# ND-LAr / 2x2 Detector Simulation

JINST 18 P04034 (2023)

# Summary

- DUNE's near detector is critical to achieving its physics goals
- ND-LAr is at the heart of the DUNE near detector
  - On track to begin build in 2026-2027, operations in 2030-2031
- The 2x2 Demonstrator is coming online imminently and will measure DUNE's very first neutrinos! (\*not for DUNE's main physics measurements, but still...)

*April 2024 2x2 Analysis Workshop @ Fermilab*

# Thank you!

*January 2024 DUNE Collaboration Meeting @ CERN*

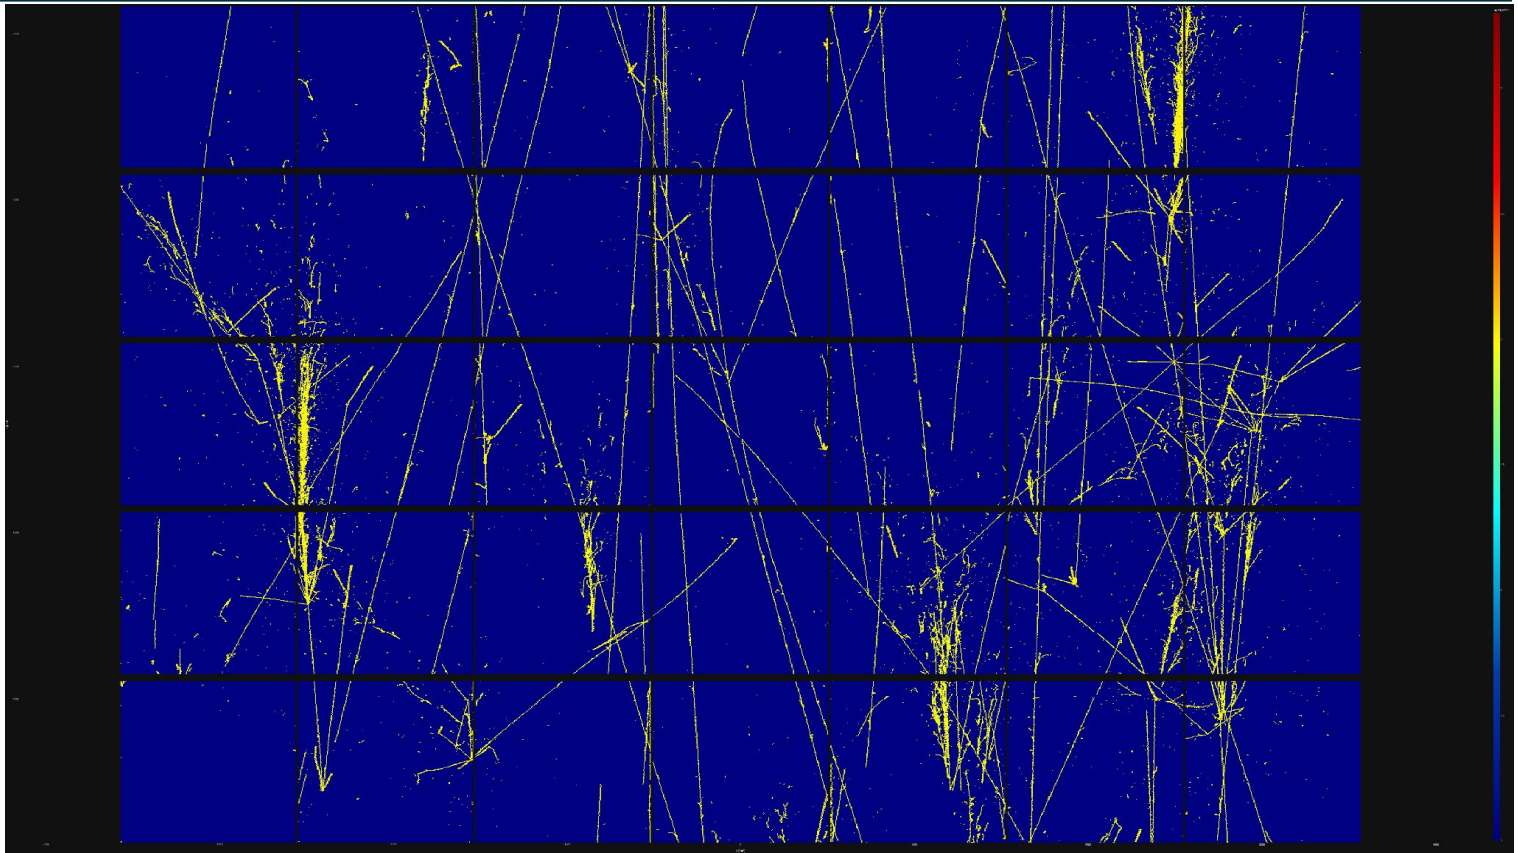

# Backups

# 1.2 MW LBNF Spill Simulation

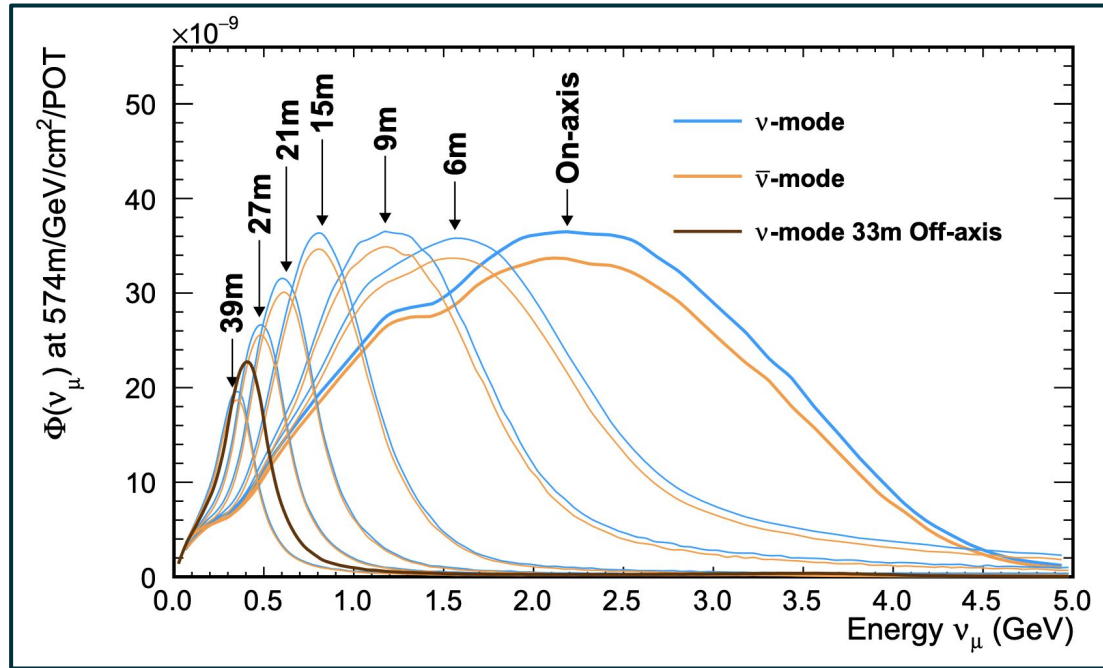

# 1.2 MW LBNF Spill Simulation (inc. det. sim.)

# 1.2 MW LBNF Spill Simulation (inc. det. sim.)

# DUNE/LBNF Off-axis Fluxes (PRISM)

Deep Underground Neutrino Experiment (DUNE), Far Detector Technical Design Report, Volume II: DUNE Physics. arXiv:2002.03005

# LArPix Charge Readout System

- Pixel tile PCB containing 1000's of pixels/ft<sup>2</sup> and minimal active components
- LArPix ASIC loaded onto backside of pixel tiles
- Single 34-pin ribbon cable per tile
- PACMAN controller
  - Delivers clean power to 100's of ASICs
  - Establishes I/O with ASICs
  - Handles DAQ and configuration for up to 8 tiles

# ND-LAr / 2x2 Analysis Pipeline

- Analysis pipeline being prepared to promptly analyze 2x2 data
  - End-to-end simulation
  - Data processing
  - Calibrations
  - Event reconstruction
  - High level analysis
  
- Directly portable to ND-LAr (MINERvA stand in for downstream muon spectrometer)
